

.pl Registry Lock

Top Level Domain Protection

.pl domain registry

What is .pl Registry Lock?

It is the service providing an extra layer of protection, on the registry level, against unauthorized or accidental administrative changes of a domain name, attempted deletion or takeover due to, e.g. cyberattack, error or unauthorized action of third parties. The service prevents from executing certain actions on a domain name without an explicit consent of the registrant, e.g. deletion of a domain name, change of registrant's data, change of domain name delegation and transfer of a domain name to other registrar.

.pl Registry
LOCK

Who is the recipient of the .pl Registry Lock service?

The .pl Registry Lock solution is targeted, in particular, at the registrants who pay strong attention to the security of their domain names. The service is dedicated to demanding recipients, for whom the guarantee of security and stability of maintained resources is of strategic importance, e.g. global corporations, large enterprises and organizations, e-commerce sector and trade mark holders.

How to secure your domain name?

A registrant, interested in covering their domain name with .pl Registry Lock, should file an appropriate request at their registrar. A registrar submits to the registry a service activation order through a multi-stage authentication method. Activation of the service is confirmed to a registrant by an email notification.

From now on you can take advantage of the Top Level Domain Protection.

To what risks is a registrant of a domain name, not secured with .pl Registry Lock, exposed?

A major threat is domain hijacking, i.e. taking administrative control over a domain name, allowing to change the delegation of a domain name, **that is specifying other name servers servicing a particular domain name or transfer of a domain name, consisting in changing a registrar, handling a domain name, by an unauthorized person having access to e.g. a registrar client panel or e-mail address of a registrant of the domain name under attack.** The actions, described above, may lead to reroute www, e-mail and other corresponding services to a different location, allowing an offender to freely administer the content of those services, and thus expose a registrant to economic loss and reputational damage.
